

Keep this leaflet safe, as you may need to refer to it again. Please ask your vet if you have any further questions.

This medicine has been prescribed for your horse ONLY. Do not take it yourself or give it to another person or any other animal; it may harm them even if their symptoms appear to be the same and could result in inadvertent contravention of Horse Passport legislation.

While BEVA have made every effort in preparing this information leaflet, the contents and any statements are made in good faith purely for general guidance and cannot be regarded as substitute for professional advice. The publishers, contributors and BEVA do not take responsibility for the information provided on this leaflet and hence do not accept any liability for loss or expense incurred (by you or persons that you disseminate the materials to) as a result of relying on content in this leaflet. To this end, you are advised to consult your vet and seek his/her professional advice before taking any steps set out in this leaflet. If you are a vet, you must not rely on the contents in this leaflet without independently verifying the correctness and veracity of the contents.

Enrofloxacin

This medicine has been prescribed or given for your horse or donkey. The drug is called Enrofloxacin and may have trade names such as Baytril, Enrotron or Enroxil although other formulations may be dispensed by your veterinary surgeon. Although it is not licensed for use in these species it is being used under the prescribing cascade. such as Baytril, Enrotron or Enroxil although other formulations may be dispensed by your veterinary surgeon.

What is enrofloxacin?

Enrofloxacin is an antibiotic medicine that belongs to the fluoroquinolone group of medicines. They are used to treat infections where other antibiotics have failed to work.

This class of antibiotic is classed as **Critically Important for human health** and therefore will usually only be used if other antibiotics have been ineffective or following laboratory testing to demonstrate it is the only suitable antibiotic to treat your horse

Why has my horse been prescribed enrofloxacin? Enrofloxacin is used to treat bacterial infections of the eye, lungs, abdomen or other sites. It should not normally be used in foals.

How should I store and handle enrofloxacin? For safety, all medicines should be kept out of the reach and sight of children. There are no special storage requirements. Please wash your hands after handling this product or wear gloves when administering it to your horse.

What should I do if I run out of enrofloxacin? Usually your vet will dispense the correct amount of the product. If you run out, you should contact your veterinary surgeon to complete the course as soon as possible.

What should I do if I accidentally overdose my horse? Contact your vet. Large doses can cause severe diarrhoea that can be fatal in exceptional cases.

What should I do if I miss a dose? If a dose is missed just give the next dose at

the normal time. DO NOT give a double dose to make up for the missed dose.

If my horse is better what should I do with the remaining medicine? As with all antibiotics it is important that the full course of antibiotics is completed. Stopping early may leave some bacteria present at the site of infection that will regrow, leading to recurrence of disease that may be less susceptible (resistant) to this or other antibiotics.

If my horse is not improving what should I do?

Contact your veterinary surgeon who will review whether this is the correct drug for your horse.

Can my horse take enrofloxacin along with other medicines?

Tell your vet if you are giving your horse any other medicines.

What do I need to record in my horse's passport?

This medicine is not authorised for use in horses intended for human consumption. If section IX of your horse's passport has not been

signed you should record the use of this product in your medicines records indicating a minimum of 28 days meat withholding time.

What are the possible side effects of enrofloxacin in my horse? Some horses will go off their food. This can often be managed by syringing the product directly into the horse's mouth, rather than mixing in feed. Refrigerating the medicine may improve palatability. If your horse

stops eating completely or becomes depressed, you should **contact vet immediately and stop administering the product.**

Occasionally horses will develop diarrhoea. This can occur with ANY antibiotic and is not unique to enrofloxacin. If this occurs, you should **contact your vet immediately and stop administering the product.**

What should I do if a person accidentally takes this medicine? If a person accidentally takes this medicine you should contact NHS direct (telephone 111) or take the person to a local hospital, taking this leaflet and the bottle with you.

When managing horses with wounds to prevent contamination arising from other horses. Good hand washing with soap and water can go a long way to reducing disease spread.

The prescribing cascade: This medicine is authorised for use in human patients or other animal species and is used by vets under the 'prescribing cascade'. Your vet can explain this in further detail and explain why they are prescribing this drug for your horse. If you do not agree to the use of this medicine in your horse you should discuss this before administration.
